Introduction

Framework

Knowledge  
representation  
Consistency

Protocol

Conclusion

- Making hypotheses
  - Background theory
  - Observations
  - "Adequate" Hypothesis
- Distribution
  - How are data distributed ?
  - What knowledge about system ?
  - Communication constraints
  - Local reasoning

# Learner-Critic Approach

- Based on general framework abstracting away from local reasoning
  - Consistency relation (at different level)
  - Local Hypothesis Formation and Critic processes
- Principles
  - Propose
  - Counter-exemple
  - Accept
- With  $n$  agents
  - Static (complete graph)
  - Static with propagation (connected graph)
  - Rumor-like propagation

Distributed  
Hypotheses

Introduction

Framework

Knowledge  
representation  
Consistency

Protocol

Conclusion

# Conditions

- But...

- only works for a compositional consistency relation :

$$\text{Cons}(h, K_1) \wedge \text{Cons}(h, K_2) \text{ iff } \text{Cons}(h, K_1 \cup K_2)$$

- Not realistic in some applications (especially with abduction)

- Simple problem where no compositionality

- Cover set abduction with distributed background theory
- First step : Horn Clause with observations as heads

# Distributed Diagnosis

Distributed  
Hypotheses  
Finding using  
SOLAR

Introduction

Framework

Knowledge  
representation  
Consistency

Protocol

Conclusion

- **Distributed sources of informations**
  - Different part of a global theory
  - Observes locally
  - **Make hypotheses (diagnoses locally)**
- Aim : solve such a system without centralizing everything
  - No recognized authorities
  - Better practicability (get only useful informations)
  - Privacy concern ?
- Context of this work
  - Global consistency of theories and observations
  - Each entity is autonomous

# Distributed Diagnosis

- Distributed sources of informations
  - Different part of a global theory
  - Observes locally
  - Make hypotheses (diagnoses locally)
- Aim : solve such a system without centralizing everything
  - No recognized authorities
  - Better practicability (get only useful informations)
  - Privacy concern ?
- Context of this work
  - Global consistency of theories and observations
  - Each entity is autonomous

# Distributed Diagnosis

- Distributed sources of informations
  - Different part of a global theory

Inoue

Introduction

Framework

Knowledge  
representation  
Consistency

Protocol

Conclusion

Here we consider only **Individual** knowledge (no explicit common information).

- Non-revisable knowledge : individual informations
  - Individual Theory  $\mathcal{T}_i^I$  : *individual knowledge*
  - Observation set  $O_i$  : *acquired factual knowledge*  
**Manifestation set**  $M_i \subseteq O_i$  : *non self-explanatory*
- Revisable knowledge : hypotheses.
  - set of Hypotheses  $H_i$
  - **favorite** hypothesis  $h_i$

Consistency

Protocol

Conclusion

## 1 Introduction

## 2 A framework for hypothesis formation in a society of agents

- Knowledge representation
- Coherence and Completeness

## 3 Protocol

## 4 Conclusion

# Coherence and Completeness

Need to capture consistency, or adequation, of an hypothesis  $H$  with non-revisable knowledge  $\mathcal{T}$ .

## ■ Coherence

- Cannot derive contradictions from  $(H, \mathcal{T}) : (H, \mathcal{T}) \not\models \perp$
- Needed to ensure soundness of subsequent reasoning
- No coherent hypothesis if  $\mathcal{T} \models \perp$

## ■ Completeness

- Can non-trivially derive all manifestations  $M$  from hypothesis and theory :  $(H \cup \mathcal{T}) \setminus M \models M$
- if only a subset of  $M$  is derived : **partial** hypothesis (complete with unexplainedManif)

# Coherence and Completeness (2)

Need to capture consistency, or adequation, of an hypothesis  $H$  with non-revisable knowledge  $\mathcal{T}$ .

- Individual aspect
  - Internal coherence/completeness
  - $\mathcal{T}$  is the full individual theory  $\mathcal{T}_j \cup O_j$
- Within groups
  - Group coherence/completeness
  - $H$  should be coherent/complete with the union of the individual theories  $\mathcal{T}_i$ .

# Example

Horn Clause, with observations as heads and abducibles as body.

## ■ Theory

```
[hasSymptom(fever), -hasDisease(flu)]
```

```
[hasSymptom(throatache), -hasDisease(angina)]
```

```
[hasSymptom(fever), -hasDisease(angina)]
```

```
[hasSymptom(mucus), -hasDisease(flu)]
```

```
[hasSymptom(mucus), -hasDisease(rhino)]
```

## ■ Observations

```
[hasSymptom(fever)]
```

```
[-hasSymptom(mucus)]
```

```
[hasSymptom(throatache)]
```

- 5 (Critic) Check external coherence ( $h_i$  coherent for  $(\mathcal{T}_j, O_i)$ )
- 6 (Critic) Check minimality

# Protocol

- 1 (Learner) Compute hypothesis ( $h_i$  consistent for  $(\mathcal{T}_i, O_i)$ ).
- 2 (Learner) Check external coherence ( $h_i$  coherent for  $(\mathcal{T}_i, O_j)$ )
- 3 (Critic) Check coherence ( $h_i$  coherent for  $(\mathcal{T}_j, O_j)$ )
- 4 (Critic) Check completeness ( $h_i$  complete for  $(\mathcal{T}_j, O_j)$ )
- 5 (Critic) Check external coherence ( $h_i$  coherent for  $(\mathcal{T}_j, O_i)$ )
- 6 (Critic) Check minimality

# CF tasks (1)

- Computing hypothesis
  - $R \cup (O \setminus M) \cup \neg M \models \neg H$
  - Production field : hypothesis field (`hasDisease(X)`)
- Extended Hypothesis
  - $R_{ext} \cup (O \setminus M) \cup \neg M \models \neg H$
  - Production field : extended hypothesis field  
(`hasDisease(X)`, `unexplainedManif(X)`)
- Computing context (external coherence and completeness) :
  - $R_{ext} \cup O \cup H \models Ctx$
  - Production field : observation field (`hasSymptom(X)`)

# CF tasks (1)

- Computing hypothesis

- $R \cup (O \setminus M) \cup \neg M \models \neg H$

- Production field : hypothesis field ( $\text{hasDisease}(X)$ )

- Extended Hypothesis

- $R_{ext} \cup (O \setminus M) \cup \neg M \models \neg H$

- Production field : extended hypothesis field  
( $\text{hasDisease}(X)$ ,  $\text{unexplainedManif}(X)$ )

- Computing context (external coherence and completeness) :

- $R_{ext} \cup O \cup H \models Ctx$

- Production field : observation field ( $\text{hasSymptom}(X)$ )

# CF tasks (1)

- Computing hypothesis

- $R \cup (O \setminus M) \cup \neg M \models \neg H$

- Production field : hypothesis field ( $\text{hasDisease}(X)$ )

- Extended Hypothesis

- $R_{ext} \cup (O \setminus M) \cup \neg M \models \neg H$

- Production field : extended hypothesis field  
( $\text{hasDisease}(X)$ ,  $\text{unexplainedManif}(X)$ )

- Computing context (external coherence and completeness) :

- $R_{ext} \cup O \cup H \models Ctx$

- Production field : observation field ( $\text{hasSymptom}(X)$ )

# CF tasks (2)

## ■ Checking internal coherence

- $R_{ext} \cup O \cup H \models \dots$

- Production field : none (refutation seeking)

- get proof

## ■ Arguing completeness

- $R_{ext} \cup O \cup H \models \dots$

- Production field : target manifestation  
(`hasSymptom(ce)`)

- get proof

# CF tasks (2)

## ■ Checking internal coherence

- $R_{ext} \cup O \cup H \models \dots$

- Production field : none (refutation seeking)

- get proof

## ■ Arguing completeness

- $R_{ext} \cup O \cup H \models \dots$

- Production field : target manifestation

(hasSymptom(ce))

- get proof

# Demo

## Demonstration

# Properties

Distributed  
Hypotheses  
Finding using  
SOLAR

G. Bourgne,  
N. Maudet, K.  
Inoue

Introduction

Framework

Knowledge  
representation  
Consistency

Protocol

Conclusion

- Terminates and ensures peer-consistency
- Also ensures global consistency with  $n$  fully connected agents
- If agents are not fully connected, do not ensure global consistency
- Need to incorporate admissible context to hypotheses

# Presentation Layout

# Extensions and future work

Distributed  
Hypotheses  
Finding using  
SOLAR

G. Bourgne,  
N. Maudet, K.  
Inoue

Introduction

Framework

Knowledge  
representation  
Consistency

Protocol

Conclusion

- Base mechanism for studying fully distributed diagnosis
  - Experiments
  - Refinements (avoid redundant messages with memory)
- Heterogeneity
  - Specialized theories
  - Different role (diagnoser, critic only)
  - Observation source (with a cost ?)
- Devise global protocol
- Minimal support

Thanks for your attention.
