# Introduction of our group

- Natural Language Processing Laboratory, College of information science and engineering, Northeastern University
- Working on a variety of problems related to Natural Language Processing
  - Statistical machine translation
  - Syntactic parsing
  - Applied semantics ontology learning
  - Text mining
- Focus on patent mining from 2007
- Welcome to our homepage <http://www.nlplab.com>

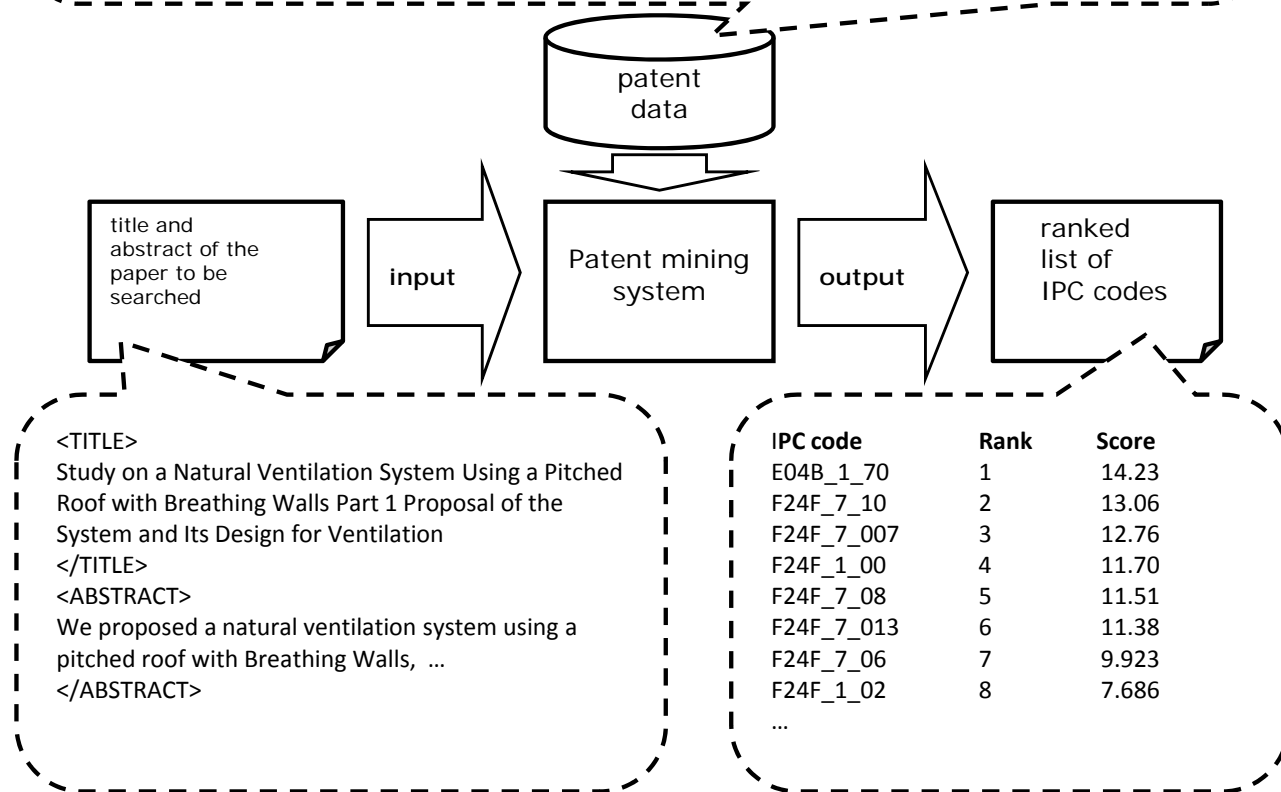

# Patent mining task at NTCIR-7

- Patent mining task
  - Mapping research papers into patent taxonomy (International Patent Classification)
- Three sub-tasks
  - English patent mining
  - Japanese patent mining
  - Cross language patent mining
- We participated in the **English patent mining sub-task**

```

<TITLE>End-ventilating adjustable pitch arcuate roof ventilator</TITLE>
<ABSTRACT>A roof ridge ventilator is provided, comprising preferably a molded ventilator, with openings along the sides thereof for passage of air therethrough and with openings at ends thereof for passage of air therethrough via gaps provided in pluralities of rows of tabs ...</ABSTRACT>
<IPC> F24F_7_02, F24F_7_007 </IPC>
<CLAIM>What is claimed is: 1. A roofing ridge ventilator for venting a roof for ...</CLAIM>
.....

```

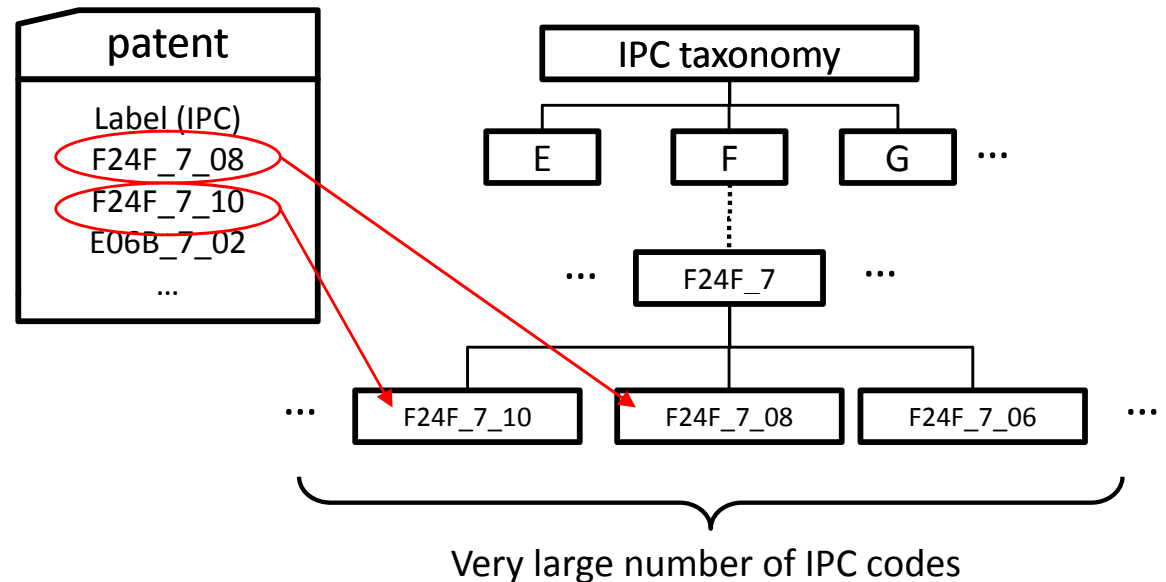

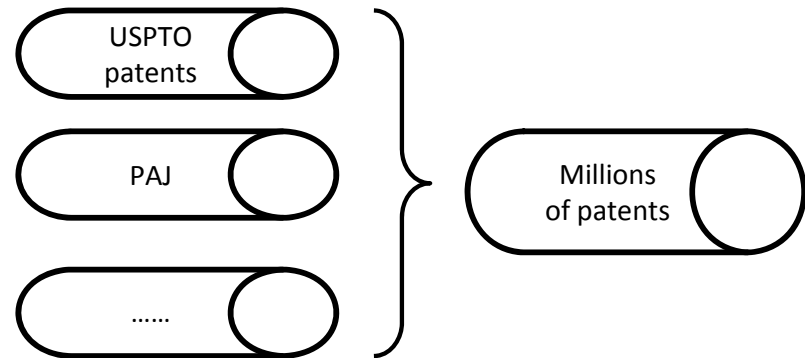

# Outline

- Overview
- **Basic idea**
- Methodology
  - KNN-based method
  - Re-ranking
- Experiment
- Discussion
- Summary

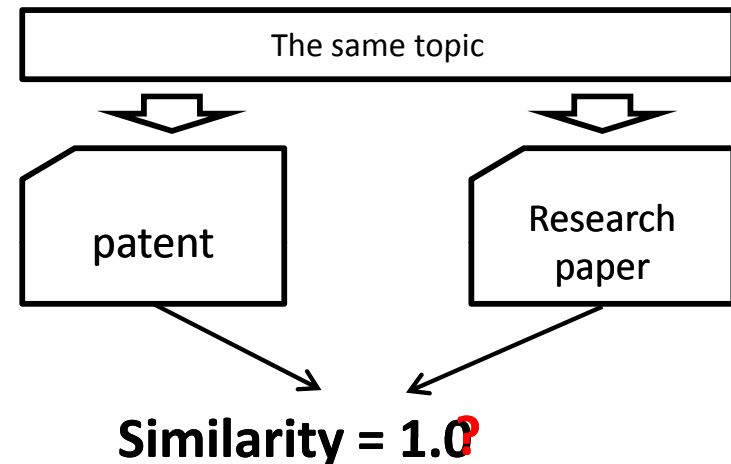

# Challenges

- Huge amount of training data
  - over 3 million training samples
  - how to train a supervised classifier or ranker
- Huge label set and multi-label
  - IPC is a hierarchical classification system which consists of more than 60,000 IPC codes.

# Challenges

- Class imbalance problem of IPC
  - The distribution of IPC codes is skewed
- Different writing styles between research papers and patents
  - conflicts with the foundational hypothesis of supervised document classification theory

# Motivation

- Difficult to apply sophisticated machine learning methods such as maximum entropy methods and support vector machines on patent mining
  - great deal of memory space and time cost is required task
  - no good solutions to multi-label classification on very large class set

- K-Nearest Neighboring (KNN) method is a comparatively easy solution
  - extracting similar examples and no training process is required
  - KNN is itself a ranking

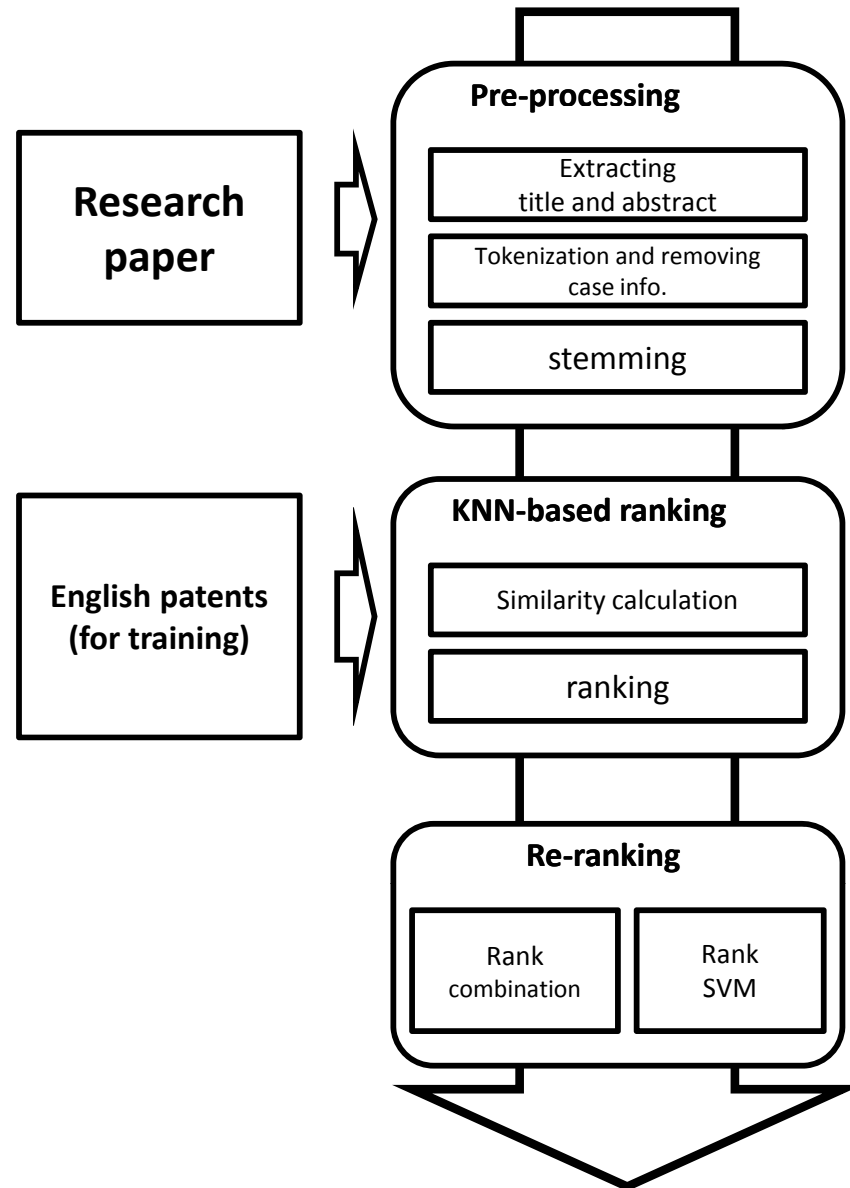

# Outline

- Overview
- Basic idea
- **Methodology**
  - KNN-based method
  - Re-ranking
- Experiment
- Discussion
- Summary

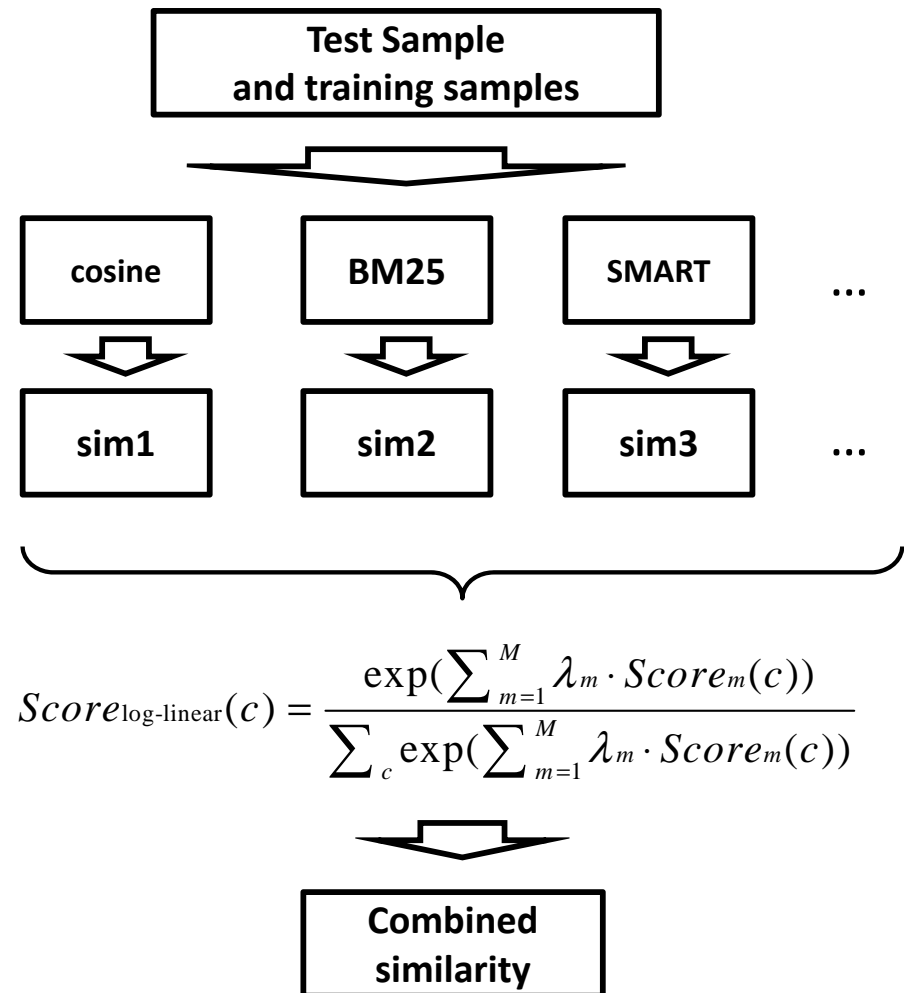

# KNN-based method

- Key components
  - KNN-based ranking
  - Re-ranking
- Each document is represented as a vector in our system

# Similarity calculation

- Calculate the similarity between the test sample (research paper) and the training samples (patents)
- State-of-the-art methods
  - Cosine + tfidf
  - BM25 (Robertson et al, 1998)
  - SMART (Buckley et al, 1996)
  - PIV (Singhal et al, 1996)
  - Or some other ...
- Log-linear method
  - Combine different similarities (features) to generate a refined similarity
  - Different weights to different features

# Ranking

- 1. Original KNN ranking method:
  - Score each IPC code by the number of its occurrence in the extracted top-k documents
- 2. Naïve method
  - the order of IPC codes follows the order of their first occurrences in the extracted top-k documents
- 3. Sum/SumAver
  - score is calculated by summing up the similarities of all the extracted documents containing the given IPC code
  - For SumAver, we average the similarity for each sample
- 4. Listweak/ListweakAver
  - to emphasize the patents ranked in the frontier part of the list, a new factor is introduced
- 5. Weak/WeakAver
  - A drawback of KNN is the prediction of the input document tends to be dominated by the classes with the more frequent examples due to the class imbalance problem
  - Punish the classes which contain more training samples

# Ranking – method 1

- 1. Original KNN ranking method:
  - Score each IPC code by the number of its occurrence in the extracted top-k documents

Suppose that we obtain the following list (top-5) after similarity calculation

| Rank | Patent(id) | IPC        | sim  |
|------|------------|------------|------|
| 1    | p02        | IPC1, IPC2 | 0.21 |
| 2    | p03        | IPC3, IPC4 | 0.11 |
| 3    | p04        | IPC2       | 0.09 |
| 4    | p05        | IPC2       | 0.09 |
| 5    | p01        | IPC1       | 0.07 |

- 2. Naïve method
  - the order of IPC codes follows the order of their first occurrences in the extracted top-k documents

- 3. Sum/SumAver
  - score is calculated by summing up the similarities of all the extracted documents containing the given IPC code
  - For SumAver, we average the similarity for each sample

| IPC  | score |
|------|-------|
| IPC2 | 3     |
| IPC1 | 2     |
| IPC3 | 1     |
| IPC4 | 1     |

IPC list after ranking

Occurred 3 times

# Ranking – method 2

- 1. Original KNN ranking method:
  - Score each IPC code by the number of its occurrence in the extracted top-k documents
- 2. Naïve method
  - the order of IPC codes follows the order of their first occurrences in the extracted top-k documents
- 3. Sum/SumAver
  - score is calculated by summing up the similarities of all the extracted documents containing the given IPC code
  - For SumAver, we average the similarity for each sample

Suppose that we obtain the following list (top-5) after similarity calculation

| Rank | Patent(id) | IPC        | sim  |
|------|------------|------------|------|
| 1    | p02        | IPC1, IPC2 | 0.21 |
| 2    | p03        | IPC3, IPC4 | 0.11 |
| 3    | p04        | IPC2       | 0.09 |
| 4    | p05        | IPC2       | 0.09 |
| 5    | p01        | IPC1       | 0.07 |

# Ranking – method 3

- 1. Original KNN ranking method:
  - Score each IPC code by the number of its occurrence in the extracted top-k documents
- 2. Naïve method
  - the order of IPC codes follows the order of their first occurrences in the extracted top-k documents
- 3. Sum/SumAver
  - score is calculated by summing up the similarities of all the extracted documents containing the given IPC code
  - For SumAver, we average the similarity for each sample

Suppose that we obtain the following list (top-5) after similarity calculation

| Rank | Patent(id) | IPC        | sim  |
|------|------------|------------|------|
| 1    | p02        | IPC1, IPC2 | 0.21 |
| 2    | p03        | IPC3, IPC4 | 0.11 |
| 3    | p04        | IPC2       | 0.09 |
| 4    | p05        | IPC2       | 0.09 |
| 5    | p01        | IPC1       | 0.07 |

| IPC  | score |
|------|-------|
| IPC2 | 0.39  |
| IPC1 | 0.28  |
| IPC3 | 0.11  |
| IPC4 | 0.11  |

IPC list after ranking

$$0.21 + 0.09 + 0.09 = 0.39$$

# Ranking – method 4

Suppose that we obtain the following list (top-5) after similarity calculation

| Rank | Patent(id) | IPC        | sim  |
|------|------------|------------|------|
| 1    | p02        | IPC1, IPC2 | 0.21 |
| 2    | p03        | IPC3, IPC4 | 0.11 |
| 3    | p04        | IPC2       | 0.09 |
| 4    | p05        | IPC2       | 0.09 |
| 5    | p01        | IPC1       | 0.07 |

$$\text{Sim} = 0.21 \times 0.9^{1-1} = 0.21$$

$$\text{Sim} = 0.09 \times 0.9^{3-1} = 0.07$$

$$\text{Sim} = 0.09 \times 0.9^{4-1} = 0.06$$

$$\text{Sim} = 0.21 + 0.07 + 0.06 = 0.34$$

| IPC  | score |
|------|-------|
| IPC2 | 0.34  |
| IPC1 | 0.25  |
| IPC3 | 0.10  |
| IPC4 | 0.10  |

IPC list after ranking

- 4. Listweak/ListweakAver
  - to emphasize the patents ranked in the frontier part of the list, a new factor is introduced
- 5. Weak/WeakAver
  - A drawback of KNN is the prediction of the input document tends to be dominated by the classes with the more frequent examples due to the class imbalance problem
  - Punish the classes which contain more training samples

# Ranking – method 5

Suppose that we obtain the following list (top-5) after similarity calculation

| Rank | Patent(id) | IPC        | sim  |
|------|------------|------------|------|
| 1    | p02        | IPC1, IPC2 | 0.21 |
| 2    | p03        | IPC3, IPC4 | 0.11 |
| 3    | p04        | IPC2       | 0.09 |
| 4    | p05        | IPC2       | 0.09 |
| 5    | p01        | IPC1       | 0.07 |

Suppose that there are 10 patents labeled with IPC2

$$\text{Sim} = 0.21 \times 0.9^{(1+10/5)} = 0.15$$

$$\text{Sim} = 0.09 \times 0.9^{(2+10/5)} = 0.06$$

$$\text{Sim} = 0.09 \times 0.9^{(3+10/5)} = 0.05$$

$$\text{Sim} = 0.15 + 0.06 + 0.05 = 0.26$$

| IPC  | score |
|------|-------|
| IPC2 | 0.26  |
| IPC1 | 0.19  |
| IPC3 | 0.07  |
| IPC4 | 0.07  |

IPC list after ranking

- 4. Listweak/ListweakAver
  - to emphasize the patents ranked in the frontier part of the list, a new factor is introduced
- 5. Weak/WeakAver
  - A drawback of KNN is the prediction of the input document tends to be dominated by the classes with the more frequent examples due to the class imbalance problem
  - Punish the classes which contain more training samples

# Re-ranking

- What have we had
  - Tens of ranked lists generated by different combinations of similarity calculation method and ranking method
- Motivation
  - Learn a better ranking from individual ranked lists (basic ranker)

**Similarity calculation:**  
obtaining the similarity between the test sample and each training sample

| cosine |       | BM25   |       | SMART  |       |
|--------|-------|--------|-------|--------|-------|
| Patent | Sim   | Patent | Sim   | Patent | Sim   |
| P01    | 0.563 | P02    | 3.161 | P03    | 0.999 |
| p02    | 0.455 | p01    | 2.942 | p01    | 0.452 |
| P03    | 0.203 | P03    | 0.235 | P02    | 0.135 |

**Ranking:**  
Assign each IPC code a score in terms of the document similarities

**Combination**

| Cosine+Sum |       | BM25 + Naïve |       | SMART+Listweak |       |
|------------|-------|--------------|-------|----------------|-------|
| IPC code   | Score | IPC code     | Score | IPC code       | Score |
| IPC1       | 3.321 | IPC1         | 3.161 | IPC1           | 1.237 |
| IPC2       | 2.300 | IPC3         | 3.161 | IPC2           | 1.213 |
| IPC3       | 1.982 | IPC2         | 2.942 | IPC3           | 0.942 |

# Rank combination

- A linear combination of ranks in individual lists

The diagram illustrates the process of rank combination. It shows three individual lists, List1, List2, and List3, each with three rows. Red boxes highlight the rows for IPC1, IPC2, and IPC3 in each list. Red arrows point from these rows to a formula below, indicating that the ranks from these rows are used in the combination.

| List1 |          |       |
|-------|----------|-------|
| Rank  | IPC code | Score |
| 1     | IPC1     | 3.321 |
| 2     | IPC2     | 2.300 |
| 3     | IPC3     | 1.982 |

| List2 |          |       |
|-------|----------|-------|
| Rank  | IPC code | Score |
| 1     | IPC1     | 3.161 |
| 2     | IPC3     | 3.161 |
| 3     | IPC2     | 2.942 |

| List3 |          |       |
|-------|----------|-------|
| Rank  | IPC code | Score |
| 1     | IPC1     | 1.237 |
| 2     | IPC2     | 1.213 |
| 3     | IPC3     | 0.942 |

$$1 / (\lambda_1 \times \text{rank}_1 + \lambda_2 \times \text{rank}_2 + \lambda_3 \times \text{rank}_3)$$

$$\text{Score}_{\text{rank-combination}}(c) = \frac{1}{\sum_{i=1}^h \lambda_i \cdot \text{rankinlist}(c, l_i)}$$

# RankSVM

- Learn a ranking function
  - Each IPC is represent as a vector, in which the feature is the score in each ranked list

| List1 |          |       |
|-------|----------|-------|
| Rank  | IPC code | Score |
| 1     | IPC1     | 3.321 |
| 2     | IPC2     | 2.300 |
| 3     | IPC3     | 1.982 |

| List2 |          |       |
|-------|----------|-------|
| Rank  | IPC code | Score |
| 1     | IPC1     | 3.161 |
| 2     | IPC3     | 3.161 |
| 3     | IPC2     | 2.942 |

| List3 |          |       |
|-------|----------|-------|
| Rank  | IPC code | Score |
| 1     | IPC1     | 1.237 |
| 2     | IPC2     | 1.213 |
| 3     | IPC3     | 0.942 |

Feature vector of IPC3 :  $\langle 1.982, 3.161, 0.942 \rangle$

# Outline

- Overview
- Basic idea
- Methodology
  - KNN-based method
  - Re-ranking
- **Experiment**
- Discussion
- Summary

# Experiment

- Data (training)
  - Patent Abstracts of Japan (PAJ)
- Settings
  - Bag-of-words model
  - No feature selection
  - $K = 100$  (for KNN)
- Evaluation
  - Mean average precision (MAP)
- Re-ranking
  - Used 6 basic rankers for rank combination
  - Used 5 basic rankers for RankSVM

# Experiment (cont.)

- KNN-based rankings (dry-run)

| Ranking $\forall$ Sim | Cosine | BM25  | SMART | PIV   | Log-linear |
|-----------------------|--------|-------|-------|-------|------------|
| Original KNN          | 35.16  | 34.79 | 35.78 | 34.51 | 35.05      |
| Naïve                 | 32.41  | 38.57 | 33.55 | 37.23 | 40.02      |
| Sum                   | 35.97  | 35.78 | 36.83 | 35.58 | 38.33      |
| SumAver               | 35.05  | 35.92 | 36.46 | 34.13 | 38.05      |
| Listweak              | 36.63  | 40.52 | 37.42 | 36.85 | 40.37      |
| ListweakAver          | 34.85  | 40.88 | 37.65 | 36.79 | 41.11      |
| Weak                  | 36.25  | 36.53 | 37.11 | 35.91 | 38.24      |
| WeakAver              | 33.42  | 36.15 | 34.90 | 33.01 | 38.38      |

- Re-ranking (dry-run)

| system           | MAP   |
|------------------|-------|
| Rank combination | 45.31 |
| RankSVM          | 43.02 |

- Re-ranking (formal-ran)

| system           | MAP   |
|------------------|-------|
| Rank combination | 48.86 |
| RankSVM          | 47.21 |

- Ranking is a key factor that affects the performance of the basic KNN-based system
- Re-ranking can improve the performance of the basic KNN-based system significantly

# Outline

- Overview
- Basic idea
- Methodology
  - KNN-based method
  - Re-ranking
- Experiment
- **Discussion**
- Summary

# Discussion – Issue 1

- Single label vs. multi-label
  - Both the training data of single label (USPTO data set) and multi-label (PAJ data set) are provided within this task.
  - However we found that the data of USPTO shows harmful to our system. The performance degrades when we trained the system on USPTO data solely or a mixed data set of “USPTO+PAJ”, comparing to training on PAJ data

Another problem:

How to train a system on heterogeneous data ?

# Discussion – Issue 2

- Two types of ranking techniques used
  - The first one is based on position of each candidate in the output list, such as Naïve, Rank combination.
  - The second one is based on the similarity score of each candidate, such as Sum and RankSVM.
- The first type of ranking is effective though they are simple.

# Discussion – Issue 3

- Does patent structure really help ?
  - Make use of features in different sections, such as title, abstract and claim.
  - It seems not helpful
  - Need further study

**<TITLE>**End-ventilating adjustable pitch arcuate roof ventilator**</TITLE>**

**<ABSTRACT>**A roof ridge ventilator is provided, comprising preferably a molded ventilator, with openings along the sides thereof for passage of air therethrough and with openings at ends thereof for passage of air therethrough via gaps provided in pluralities of rows of tabs ...**</ABSTRACT>**

**<IPC>** F24F\_7\_02, F24F\_7\_007 **</IPC>**

**<CLAIM>**What is claimed is: 1. A roofing ridge ventilator for venting a roof for air passage between the interior of a roof and the outside ambient through sides of the ventilator and through ends of the ventilator...**</CLAIM>**

.....

# Outline
