

# SYNTACTIC REORDERING FOR JAPANESE-TO-ENGLISH TRANSLATION

JASON KATZ-BROWN  
(JASONKB@GOOGLE.COM)  
MICHAEL COLLINS  
(MCOLLINS@CSAIL.MIT.EDU)  
MIT CSAIL

# MIT SYSTEM OVERVIEW

- Japanese->English Moses system.
- Two techniques to reorder Japanese during preprocessing.
  1. Just **Reverse** every word
  2. Flatten a **Cabocha** dependency tree
- **Reverse** system gives highest human eval scores of statistical systems in Patent Translation Task.

# REORDERING IN PREPROCESSING

- Reorder Japanese words into an English word order during preprocessing.
- From: 私 は ケーキ を 食べ まし た (I cake ate)
- To: は 私 た まし 食べ を ケーキ (I ate cake)
- Then word alignment and decoding can be monotonic.
- Collins (2006) introduced for German->English.

# REVERSE REORDERING

- English is mostly head-initial.
- Japanese is mostly head-final.
- Let's reverse the word order!

# REVERSE REORDERING

- Keep punctuation marks where they are.
- Keep everything before topic marker は at the beginning.
- Reverse everything.
- 嬉しい 私は ケーキを食べました  
は私の嬉しだまし食べをケーキ (Good!)
- 嬉しい 私が ケーキを食べました  
たまし食べをケーキ が私の嬉し (Bad!)

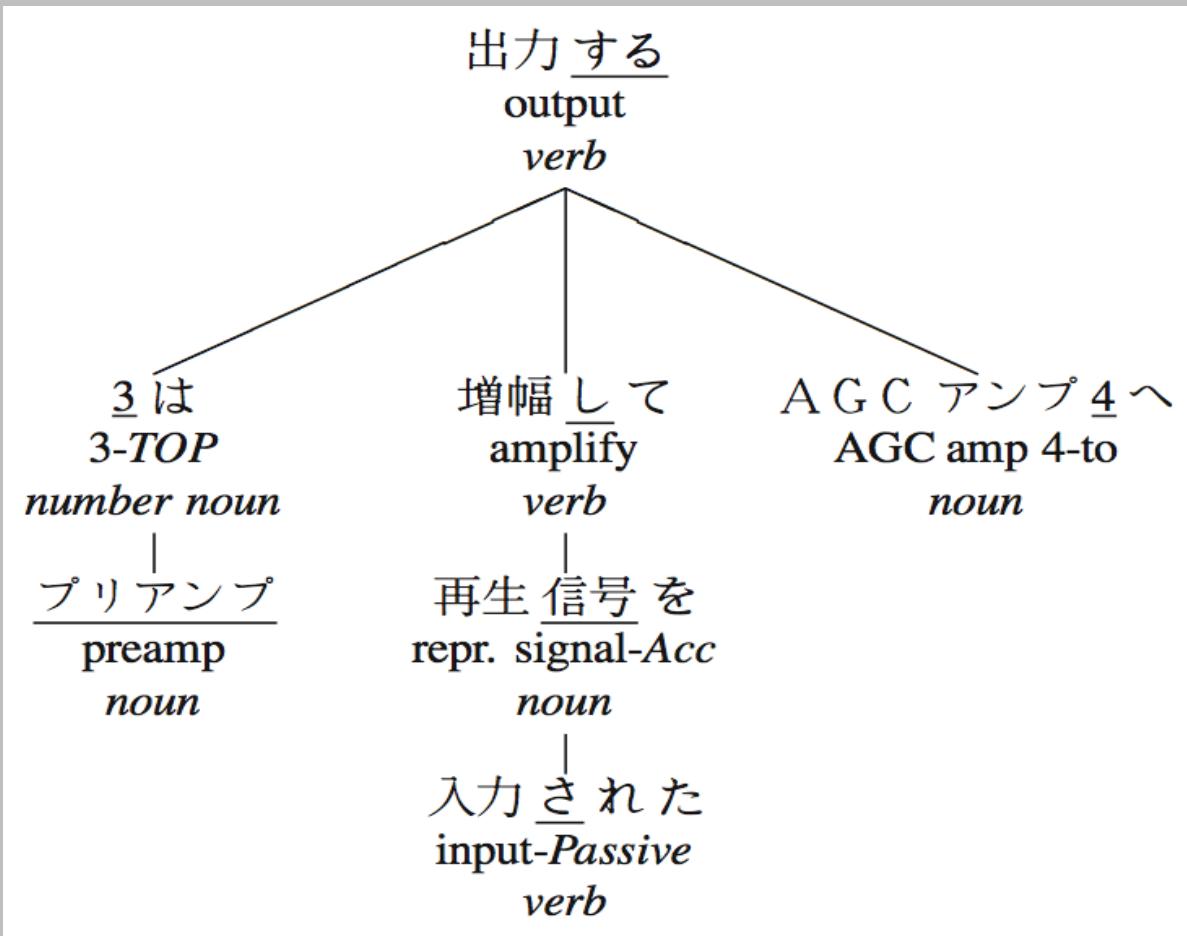

# REVERSE REORDERING

- From: プリアンプ 3 は 入力された 再生 信号 を 増幅 して AGC アンプ 4 へ 出力 する。
- To: は 3 プリアンプ する 出力 へ 4 アンプ AGC でし 增幅 を 信号 再生 たれ さ 入力 。
- *The pre-amplifier 3 outputs to the agc amplifier 4 amplifies the input reproduction signal.* (DistortionLimit=0)
- *The preamplifier 3 and outputs it to the AGC amplifier 4 amplifies the input reproduction signal.*  
(DistortionLimit=9)

# CABOCHA REORDERING

- Flatten a Cabocha dependency tree.

は 3 プリアンプ する 出力 てし 増幅 を  
信号 再生 たれ さ 入力 へ 4 アンプ AGC。

1. Flatten verbs after their subjects, before their objects.
2. Flatten all others before their children.
3. Reverse within chunks.

# REORDERING EXPERIMENTS

<i>DistortionLimit</i>	BASELINE	REV	CABOCHA	Seconds per sentence <sup>a</sup>
0	20.86	20.32	21.61	2.2
6	23.76	25.44	24.79	5.0
9	25.24	25.49	25.12	7.8
unlimited	26.07	25.08	24.58	37.2

- In monotonic translation (DistortionLimit=0), **Cabocha** reordering is best.
- With some distortion allowed in decoder (DistortionLimit=6), **Reverse** reordering is best.
- With unlimited distortion allowed in decoder (DistortionLimit= $\infty$ ), **no reordering** is best.

# NTCIR PATENT MT RESULTS

Formal Run ID	Preorder	BLEU	Adequacy	Fluency	Seconds per sentence
MIT (1)	REV	27.14	3.15	3.66	8.4
MIT (2)	CABOCHA	26.44	(N/A)	(N/A)	8.0
Moses	BASELINE	27.14	2.81	3.55	18.2
tsbmt	(N/A)	26.44	3.81	3.94	0.23

Our system compared to Moses baseline:

- Twice as fast decoding.
- Same BLEU score.
- Improved manual evaluation.

Our system compared to rule-based:

- Much worse :-)

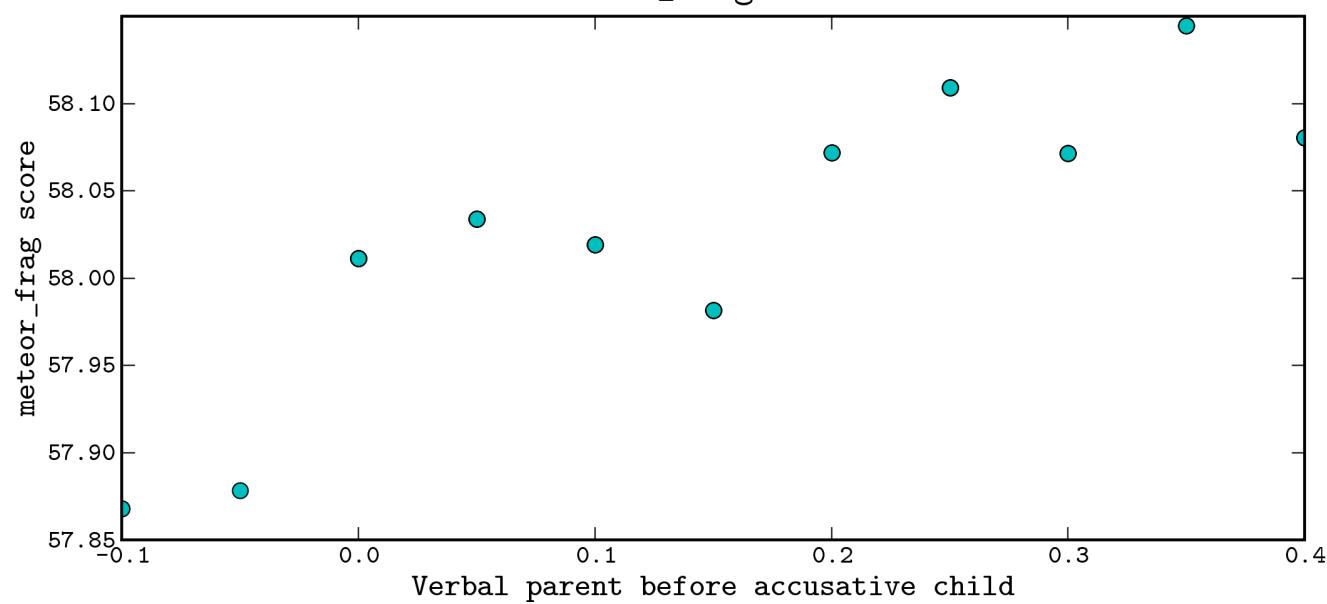

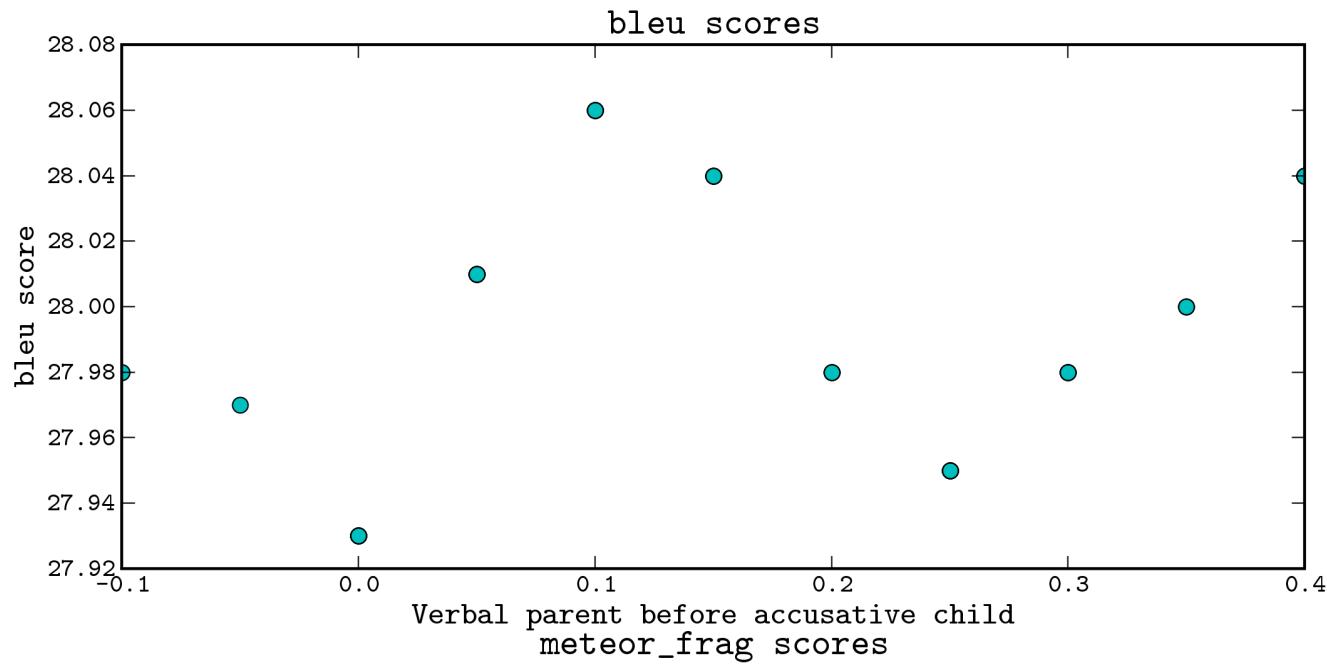

# VERB-BEFORE-OBJECT FEATURE

- Feature = 1 if a verb is translated before its object.
- Feature = 0 otherwise.

'Verbal parent before accusative child' against bleu, meteor\_frag

# CONTRIBUTIONS

- Quick and effective reordering strategy for preprocessing
- Better translation quality and faster than baseline Moses
