NTCIR-10 RITE2 Poster ID - RITE05

Task and basic idea

BC subtask: Given a text pair $\langle t_1, t_2 \rangle$, identify whether t_1 entails a hypothesis t_2 or not

ExamBC subtask: Multiple-choice questions of real university entrance exams

The basic idea: Classification based on word correspondence and syntactic & semantic information

Features

Correspondence

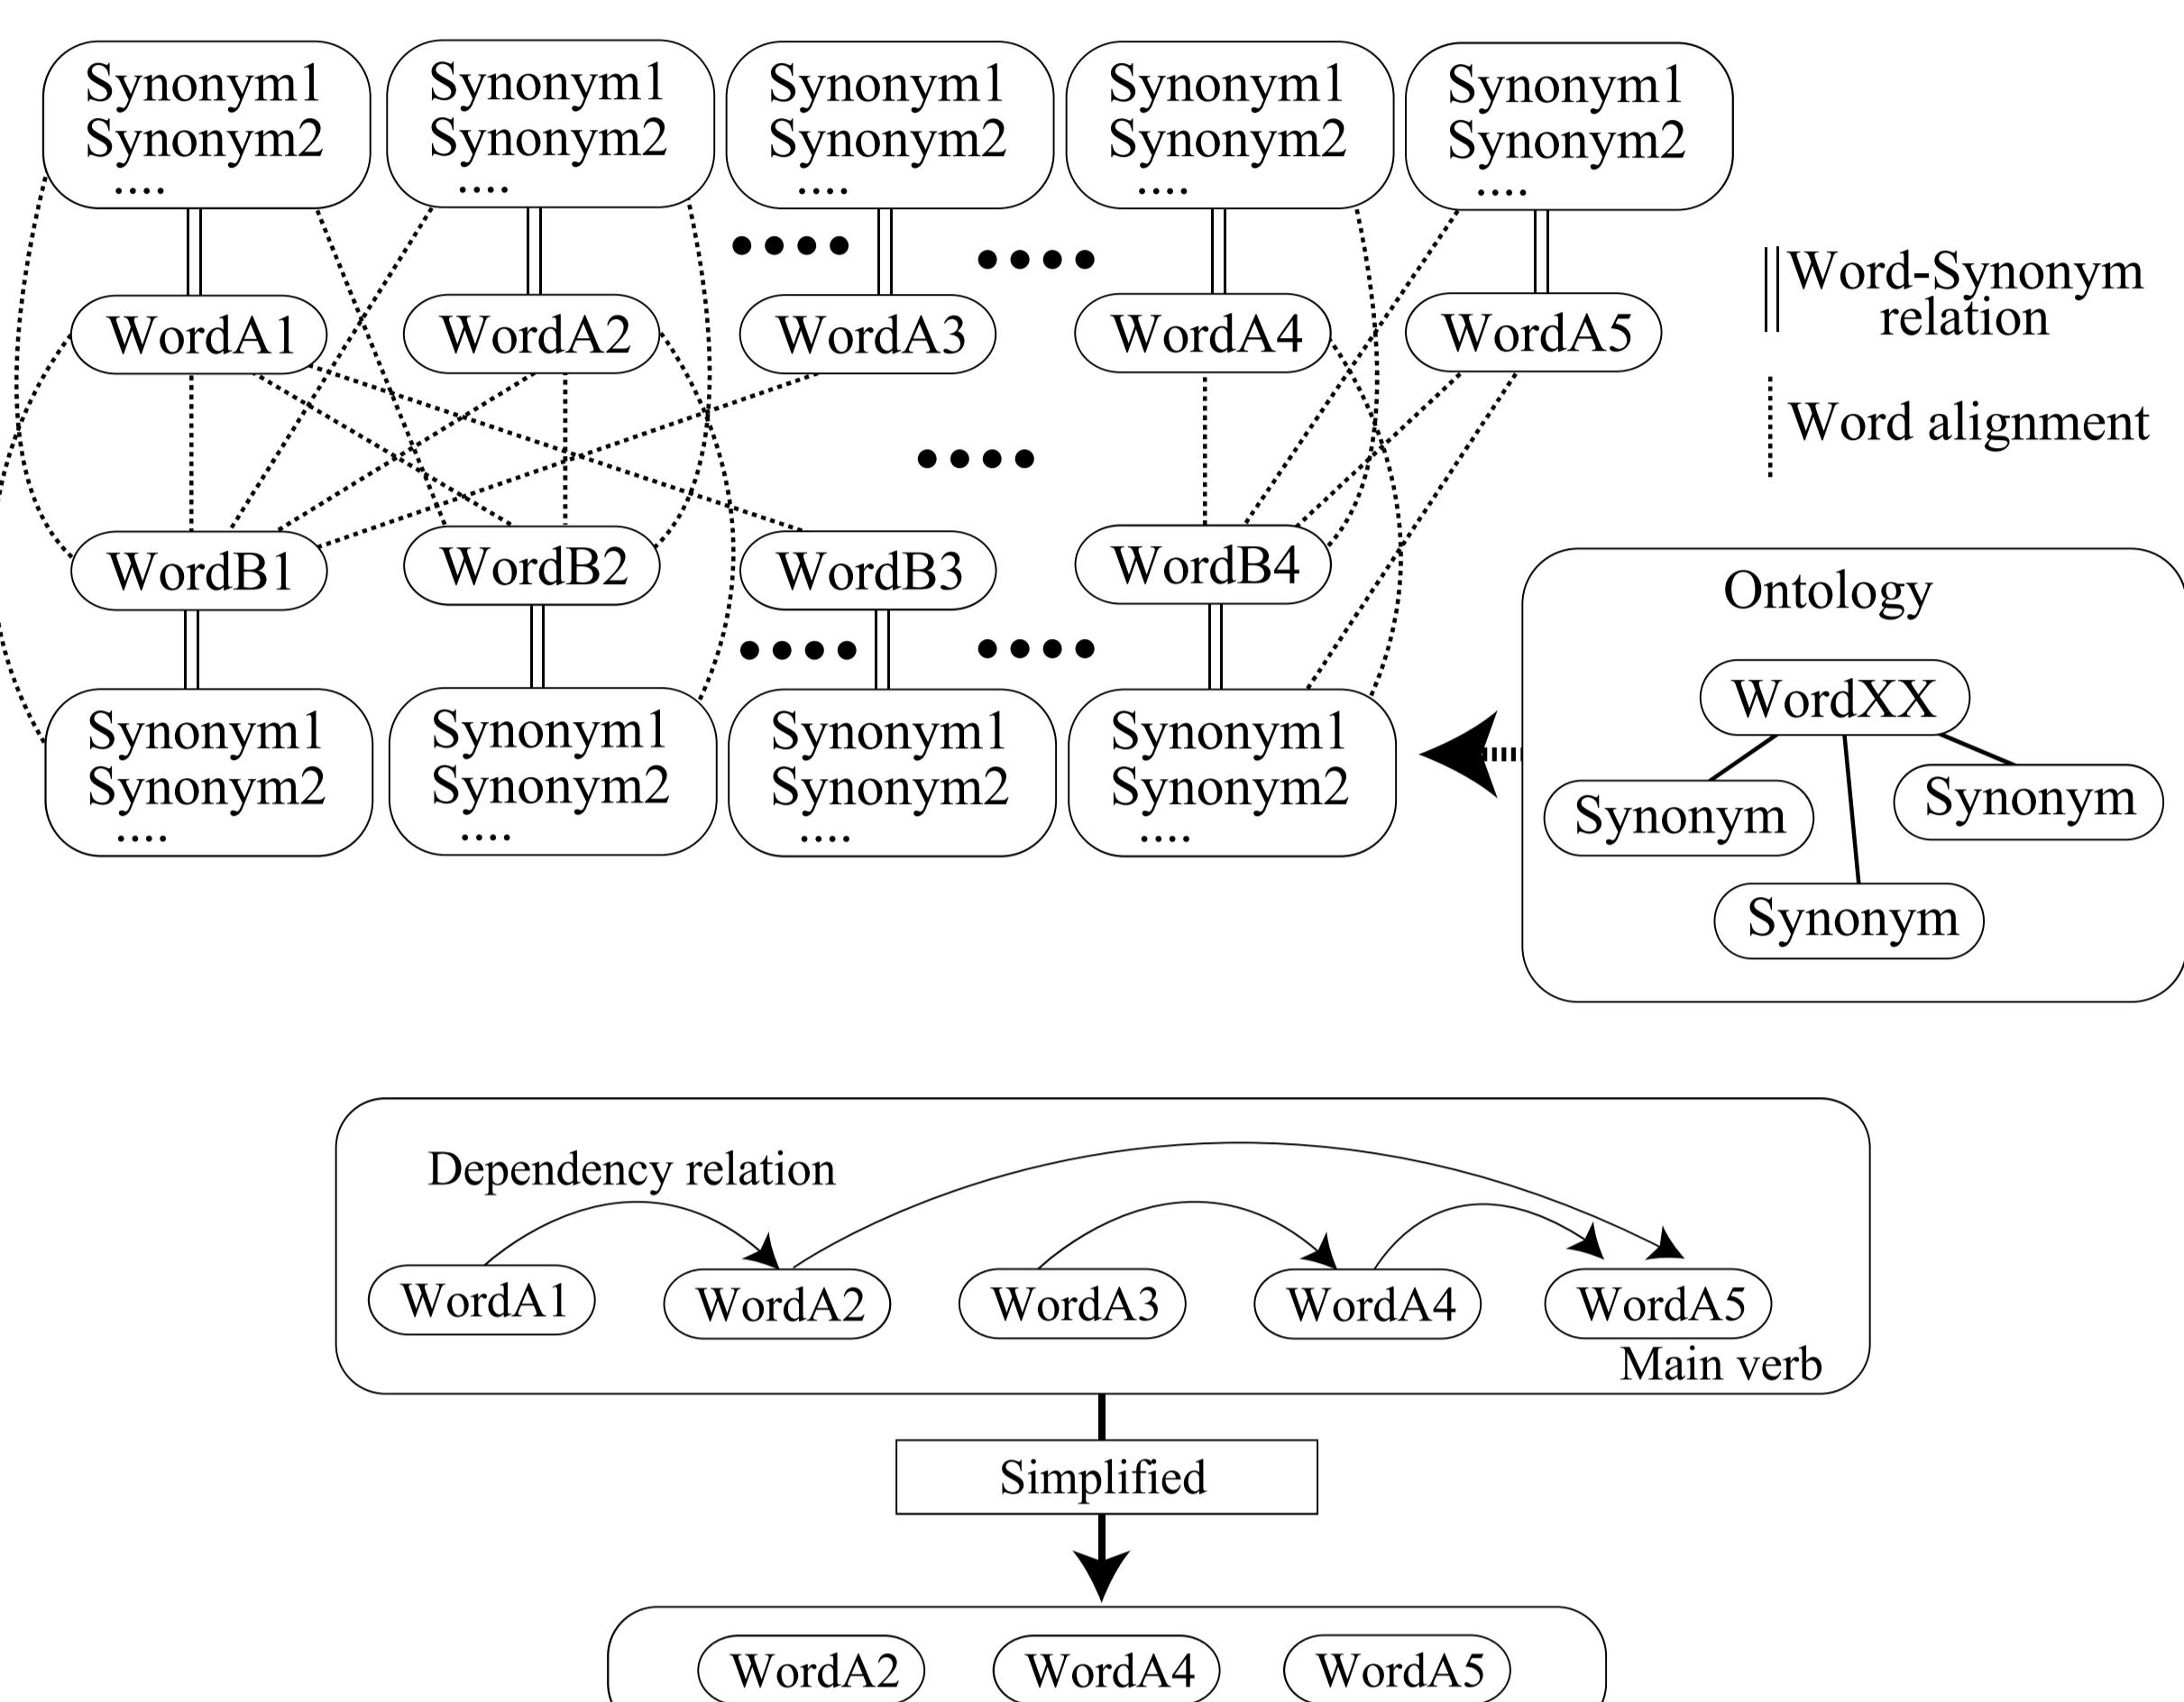

- Word overlap and edit distance between t_1 and t_2
- Expansion with ontologies; Japanese WordNet and Nihongo-Goi-Taikei
- All word, content word and simplified word lists

Syntactic and semantic information

- Hierarchical Directed Acyclic Graph (HDAG)

Others

- # of negation words and sentence length

Classifier

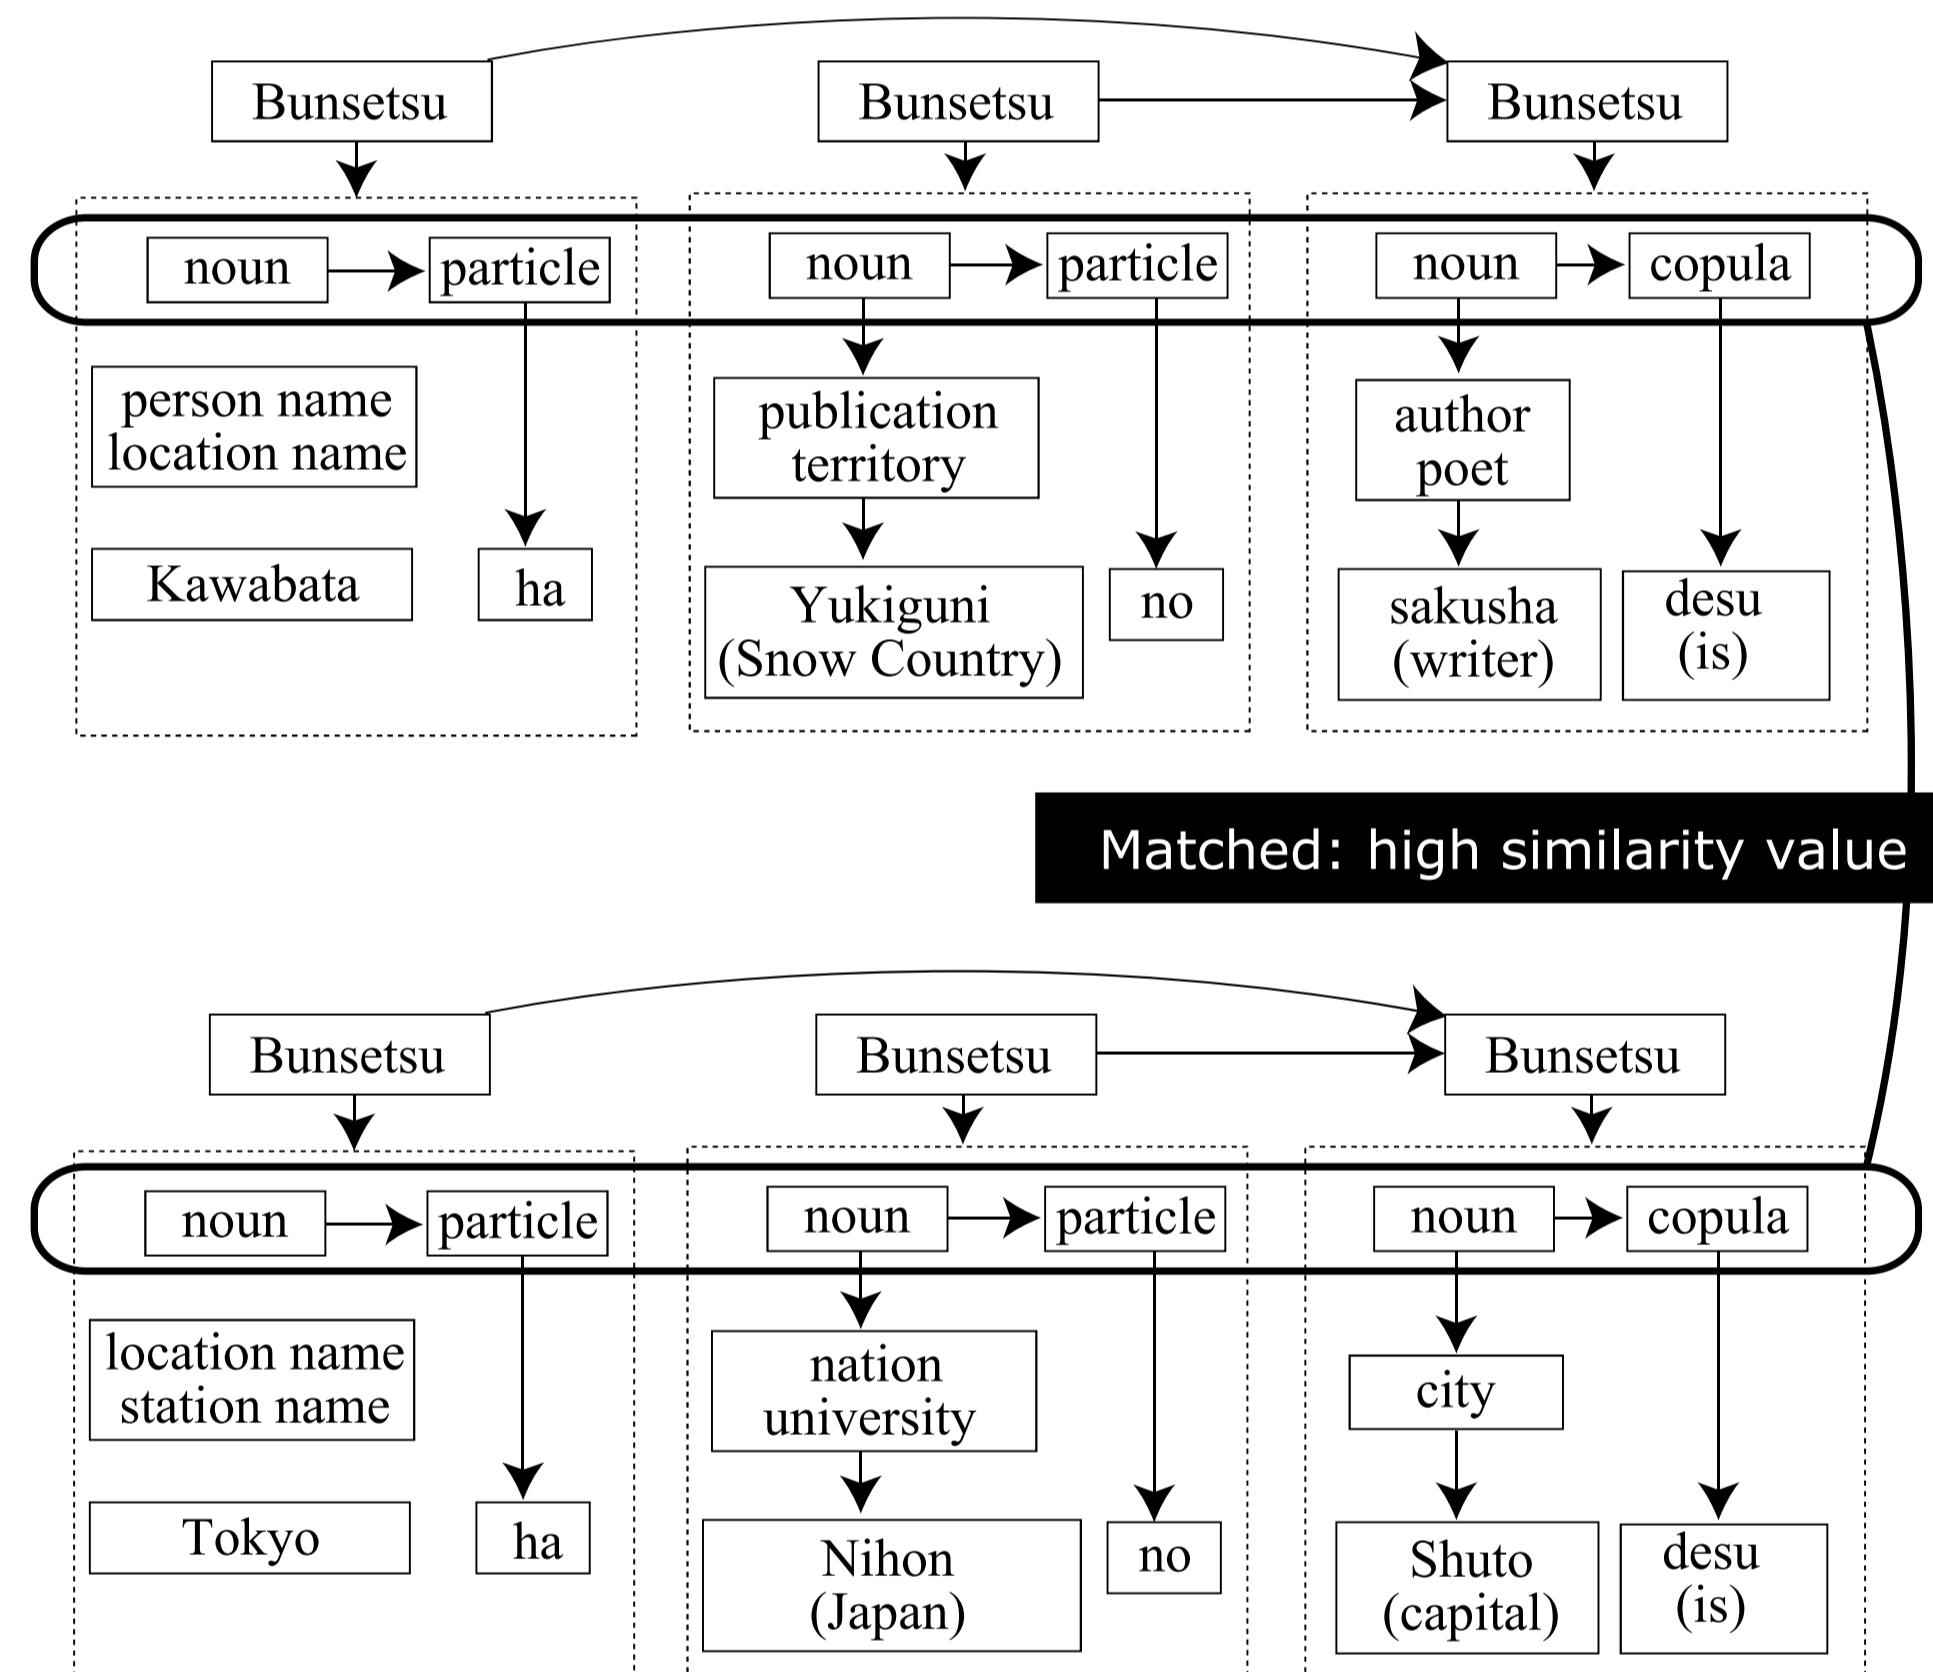

BC task

- SVM (MethodBC1), Logistic regression (MethodBC2), Rotation forest (MethodBC3)

ExamBC task

- AdaBoost with SVM (MethodEX1), Logistic regression (MethodEX2), Weighted Voting (MethodEx3)

$$Score = \frac{\alpha \times SVM + \beta \times Logistic + \gamma \times Rotation\ Forest}{3}$$

Discussion and Future Work

- Ontologies are important
- Confidence value is important for the ExamBC task
- Optimal parameters for the voting method
- Structure of HDAG
